

I had an enjoyable time during the semester with this class. For me it was kind of a break from a difficult schedule between classes. I think the way the class was given couldn't be better as I didn't feel bored or stressed about understanding the topics, maybe at the end of the semester it felt kind of rushed as we didn't have much time. Regardless, I think it is very easy to understand the class and become fond of programming.

I especially enjoyed making the personal website, I think it was a great activity for us to get to know the language and the capabilities we could exploit with them. I would have liked to continue working on this project and see the evolution of that website.

Personally, I couldn't manage my time to finish the portfolio, I tried but I didn't have the time and spent way too much time working on the final project. I think maybe it could be a good idea to get the portfolio done by the second partial so that at the end of the semester we could focus entirely on delivering a good product for the final project.

I got too ambitious for my final project and didn't consider the difficulties of the portfolio and getting it done. I even consider that some changes could have been made to my final delivery of the website, as some components like buttons and accordions don't work entirely well in design.

I think my biggest enemy in this class was time, even if I started working early I had some troubles and difficulties that required a lot of my time. I shouldn't have gone confident about the transition between my ejs files and react, I had many issues to make it work and connect things between pages.

The skills I acquired were learning this new language and the importance of having a good organization between files, it was very difficult having everything inside a single file, like the css for my project. I noticed the importance of naming things properly and even tagging, as sometimes I saw pieces of my coding and wouldn't know what they did or their purpose by looking at it. Now I know the importance of it.

I gained the satisfaction of getting things done and looking at them working as I originally imagined was magical and gave me a sense of accomplishment that I enjoyed. It was challenging but I had fun with it and made me look for more information than the one given in classes. Honestly, this class for me was a breakthrough in the engineering topics given in school and helped me get creative in designing, problem solving, etc.

Even with the challenges and difficulties, I had a great time and this class made me enjoy working on something that could become creative and personalized, even though I was programming most of the time. Thank you very much :)
